Insurance0 is a small specialist medical insurance provider and as such very concerned with security and privacy. There has been an incident recently where some accounts were attempted to take over by a 3rd party via brute-force. This has triggered a wider investigation into their security posture and showed that it will most likely be better for them to outsource this part of their infrastructure.

Desired situation

One of the key factors for them is privacy and that's when they told us that they ideally do not want to store any PII within our systems or at least minimize it as much as possible. They also already have a fairly complex AuthZ system in place and would rather not want to replace that.
