Topic #5

Payslip0

Current situation

Use Case	B2B2E
Users	500k MAU
Authentication	Self-build Username/Password Authentication

Payslip0 is providing various HR services to business customers, who in return allow their employees to use these services to apply for time off or download their payslips. Currently this is all based on their own Authentication System but they get more and more requests for federation for bigger customers. One of their biggest challenges to date is to manage the various users and the security policies along that (MFA, different password strength) for the different customers. They are in a bid for their largest customer to date but to be successful SSO & federation is a must-have to offer.

Desired situation

They would like to offer federation into their customers (at least SAML Protocol) and ideally have their customer onboard themself. It would be nice to be able to offer a customized experience for their larger customers to blend more in with the CI of those. Also with some of these larger customers they might get more into the focus of malicious actors so strengthening themselves against attacks is something that they are looking into.
